

Miguel Core unified daemon

Individual printable topic report.

Why I built it

Early systems had separate daemons, command scripts, and services. Miguel Core consolidated the control surface into a local Python daemon that could coordinate chat, streaming, voice, memory, model tiers, orchestration, state, and tool endpoints.

Architecture and evidence

Central file ``miguel_core.py`` documents the consolidation goal and exposes the route surface. ``orchestra.py`` implements async worker delegation to Opus, Codex, GPT-style workers through a subprocess layer with timeouts, cancellation, status, and stats.

Claim boundary: Local experimental control plane, not a hardened commercial security product.

- One daemon replaces fragmented service surfaces.
- Routes cover chat/streaming, voice, state, vault, knowledge, prediction, cascade, agents, metacognition, orchestra, macOS/tool endpoints, and conversations.
- Imports connect memory broker, CASS pipeline, vault watcher, prediction, metacognition, state graph, orchestra, and macOS bridge.
- Startup/handover scripts define model routing, state probes, boot checks, and autonomy rings.

What I can show with this

- Ability to consolidate fragmented prototypes into a local control plane.
- Understanding of agent systems as services with routes, state, health, models, memory, and tools.
- Experience with broad API surfaces while still thinking about boot probes and autonomy rings.
- Practical path from scripts and separate daemons toward one observable operating layer.
- Agent reliability depends on process state, permissions, memory, model availability, and user intent.
- A route existing is not the same as a route being production-hardened.
- Local-first systems still need explicit observability and failure boundaries.
- Autonomy rings are a useful design language for separating safe actions from user-only actions.
- Create a public demo mode with secrets disabled.
- Add endpoint-level permission metadata.
- Add machine-readable health reports for all major modules.
- Shrink the public API surface into documented stable interfaces.
